

# Problem 1

$R(A, B, C, D, E, F)$

$F = \{$   
   $FD1: A \rightarrow BC,$   
   $FD2: C \rightarrow AD,$   
   $FD3: DE \rightarrow F$   
 $\}$

## Part A

Decomposition(FD1)

= FD4:  $A \rightarrow B$

Decomposition(FD2)

= FD5:  $C \rightarrow A$

Transitivity(FD5, FD4)

= FD6:  $C \rightarrow B$

## Part B

Decomposition(FD1)

= FD7:  $A \rightarrow C$

Decomposition(FD2)

= FD8:  $C \rightarrow D$

Transitivity(FD7, FD8)

= FD9:  $A \rightarrow D$

PseudoTransitivity(FD9, FD3)

= FD10:  $AE \rightarrow F$

## Problem 2

```
function ComputeAttrClosure(X, F)
  X+ := X;
  repeat until X+ has not changed
    foreach FD in F
      if FD Y → Z such that
        (i) Y is a subset of X+, and
        (ii) Z is not a subset of X+ do
          X+ := X+ U Z
  return X+;
```

### Part A

```
X = {A}
X+ = ComputeAttrClosure(X, F)
    = {A, B, C, D}
```

### Part B

```
X = {C, E}
X+ = ComputeAttrClosure(X, F)
    = {C, E, A, D, F, B}
    = {A, B, C, D, E, F}
```

## Problem 3

$R(A, B, C, D, E, F)$

$F = \{$   
     FD1:  $AB \rightarrow CDEF$ ,  
     FD2:  $E \rightarrow F$ ,  
     FD3:  $D \rightarrow B$   
 $\}$

### Part A

import ComputeAttrClosure from "Problem 2"

Observations:

- A is only available on the left-hand side  
     → Must be part of a candidate key (and a superkey)
- C and F are only available on the right-hand side  
     → Cannot be part of a candidate key

Start with the largest set containing all attributes that must be part of a candidate key, as well as all attributes that can be part of a candidate key:

$X = \{A, B, D, E\}$   
 $X^+ = \text{ComputeAttrClosure}(X, F)$   
      $= \{A, B, D, E, C, F\}$   
     # superkey

Repeat for all permutations of superkeys with one of the non-mandatory attributes removed:  
     →  $\{A, B, D\}, \{A, B, E\}, \{A, D, E\}$

$X = \{A, B, D\}$   
 $X_1^+ = \text{ComputeAttrClosure}(X, F)$   
      $= \{A, B, D, C, E, F\}$   
     # superkey

$X = \{A, B, E\}$   
 $X^+ = \text{ComputeAttrClosure}(Y, F)$   
      $= \{A, B, E, C, D, F\}$   
     # superkey

$X = \{A, D, E\}$   
 $X^+ = \text{ComputeAttrClosure}(Y, F)$   
      $= \{A, D, E, F, B, C\}$   
     # superkey

Repeat for all permutations of superkeys with one of the non-mandatory attributes removed:

→ {A, B}, {A, D}, {A, E}

$X = \{A, B\}$

$X^+ = \text{ComputeAttrClosure}(X, F)$

$= \{A, B, C, D, E, F\}$

# superkey

$X = \{A, D\}$

$X^+ = \text{ComputeAttrClosure}(X, F)$

$= \{A, D, B, C, E, F\}$

# superkey

$X = \{A, E\}$

$X^+ = \text{ComputeAttrClosure}(Y, F)$

$= \{A, E, F\}$

# not superkey

Repeat for all permutations of superkeys with one of the non-mandatory attributes removed:

→ {A}

$X = \{A\}$

$X^+ = \text{ComputeAttrClosure}(X, F)$

$= \{A\}$

# not superkey

**Resulting candidate keys:**

→ {A, B}, {A, D}

## Part B

FD2 and FD3, since the left-hand sides are not superkeys (a superkey must be a superset of a candidate key).

## Part C

- Let  $X \rightarrow Y$  be the FD that violates BCNF in a relation schema R
- Replace R by two new relation schemas R1 and R2 constructed as follows
- Create R1 with all the attributes in X and in Y
- Create R2 from R by removing all attributes that are in Y and not in X

$R(A, B, C, D, E, F)$

$F = \{$   
 $\text{FD1: } AB \rightarrow CDEF,$   
 $\text{FD2: } E \rightarrow F,$   
 $\text{FD3: } D \rightarrow B$   
 $\}$

- Let R be a relation schema with a set F of FDs
- Let  $R_1, R_2, \dots, R_n$  be a decomposition of R
- For every  $R_i$  we call the set of all FDs in  $F^+$  that mention only attributes from  $R_i$  the restriction of F to  $R_i$
- Then, the decomposition is dependency preserving if for the restrictions  $F_1, F_2, \dots, F_n$  of F to  $R_1, R_2, \dots, R_n$  it holds that:

Candidate keys:  
 $\{A, B\}, \{A, D\}$

$$(F_1 \cup F_2 \cup \dots \cup F_n)^+ = F^+$$

First we decompose R on the violating dependency FD2:

$R_1(E, F)$

FD2:  $E \rightarrow F$

Candidate keys:  $\{E\}$

# BCNF

$R_2(A, B, C, D, E)$

Decomposition(FD1)

= FD4:  $AB \rightarrow CDE$

FD3:  $D \rightarrow B$

Candidate keys:  $\{A, B\}, \{A, D\}$

# not BCNF

Then we decompose R2 on the violating dependency FD3:

$R_{2A}(D, B)$

FD3:  $D \rightarrow B$

Candidate keys:  $\{D\}$

# BCNF

$R_{2B}(A, C, D, E)$

PseudoTransitivity(FD3, FD1)

= FD5:  $AD \rightarrow CEF$

Candidate keys:  $\{A, D\}$

# BCNF

Lastly, we verify that the functional dependencies are preserved:

$F_1 \cup F_2 \cup F_3 = \{$   
 $\mathbf{E} \rightarrow \mathbf{F}$   
 $\mathbf{D} \rightarrow \mathbf{B}$   
 $AD \rightarrow CEF$   
 $\}$  # where  $F_n$  is the functional dependencies of  $R_n$

Since **B** is only on the right hand side, we can conclude that we cannot use **B** to deduce any other attributes. Hence, we do not have dependency preservation.

## Problem 4

$R(A, B, C, D, E)$

$F = \{$   
 $FD1: ABC \rightarrow DE,$   
 $FD2: BCD \rightarrow AE,$   
 $FD3: C \rightarrow D$   
 $\}$

### Part A

import ComputeAttrClosure from "Problem 2"

Observations:

- B and C are only available on the left-hand side  
→ Must be part of a candidate key (and a superkey)
- E is only available on the right-hand side  
→ Cannot be part of a candidate key

Start with the largest set containing all attributes that must be part of a candidate key, as well as all attributes that can be part of a candidate key:

$X = \{B, C, A, D\}$   
 $X^+ = \text{ComputeAttrClosure}(X, F)$   
 $= \{B, C, A, D, E\}$   
 # superkey

Repeat for all permutations of superkeys with one of the non-mandatory attributes removed:  
 →  $\{A, B, D\}, \{A, B, E\}, \{A, D, E\}$

$X = \{B, C, A\}$   
 $X^+ = \text{ComputeAttrClosure}(X, F)$   
 $= \{B, C, A, D, E\}$

# superkey

$X = \{B, C, D\}$

$X^+ = \text{ComputeAttrClosure}(X, F)$

$= \{B, C, D, A, E\}$

# superkey

Repeat for all permutations of superkeys with one of the non-mandatory attributes removed:

$\rightarrow \{A, B, D\}, \{A, B, E\}, \{A, D, E\}$

$X = \{B, C\}$

$X^+ = \text{ComputeAttrClosure}(X, F)$

$= \{B, C, D, A, E\}$

# superkey

**Resulting candidate keys:**

$\rightarrow \{B, C\}$

**FD3 violates BCNF, since the left-hand side is not a superkey (a superkey must be a superset of a candidate key).**

## Part B

- Let  $X \rightarrow Y$  be the FD that violates BCNF in a relation schema  $R$
- Replace  $R$  by two new relation schemas  $R_1$  and  $R_2$  constructed as follows
- Create  $R_1$  with all the attributes in  $X$  and in  $Y$
- Create  $R_2$  from  $R$  by removing all attributes that are in  $Y$  and not in  $X$

$R(A, B, C, D, E)$

$F = \{$   
 $\text{FD1: } ABC \rightarrow DE,$   
 $\text{FD2: } BCD \rightarrow AE,$   
 $\text{FD3: } C \rightarrow D$   
 $\}$

- Let  $R$  be a relation schema with a set  $F$  of FDs
- Let  $R_1, R_2, \dots, R_n$  be a decomposition of  $R$
- For every  $R_i$  we call the set of all FDs in  $F^+$  that mention only attributes from  $R_i$  the restriction of  $F$  to  $R_i$
- Then, the decomposition is dependency preserving if for the restrictions  $F_1, F_2, \dots, F_n$  of  $F$  to  $R_1, R_2, \dots, R_n$  it holds that:

$$(F_1 \cup F_2 \cup \dots \cup F_n)^+ = F^+$$

Candidate keys:

$\{B, C\}$

First we decompose  $R$  on the violating dependency FD3:

$R_1(C, D)$

FD3:  $C \rightarrow D$

Candidate keys:  $\{C\}$

# BCNF

R2(A, B, C, E)  
PseudoTransitivity(FD3, FD2)  
= FD4:  $BC \rightarrow AE$   
Candidate keys: {B, C}  
# BCNF

Lastly, we verify that the functional dependencies are preserved:

$F1 \cup F2 = \{$   
     $C \rightarrow D$   
     $BC \rightarrow AE$   
 $\}$  # where  $F_n$  is the functional dependencies of  $R_n$

Trivially,  $\langle \text{superset of } BC \rangle \rightarrow AE$ , hence:  
 **$BCD \rightarrow AE$**

Trivially,  $BC \rightarrow C$   
Transitivity( $BC \rightarrow C, C \rightarrow D$ )  
=  $BC \rightarrow D$   
Union( $BC \rightarrow D, BC \rightarrow AE$ )  
=  $BC \rightarrow ADE$   
Decomposition( $BC \rightarrow ADE$ )  
=  $BC \rightarrow DE$   
Trivially,  $\langle \text{superset of } BC \rangle \rightarrow DE$ , hence:  
 **$ABC \rightarrow DE$**

Since we have  $\{C \rightarrow D, BCD \rightarrow AE \text{ and } ABC \rightarrow DE\}$ , the original FD's in R's F, it follows that the functional dependencies are preserved.
